

ACCESS POINTERS

Full PDF Section Blueprint

What every section should contain for a professional, disability-led accessibility platform document

Purpose: To guide the structure, content, tone, evidence, and accessibility detail needed for a complete Access Pointers PDF, pitch pack, venue pack, or service explainer.

Prepared: May 2026

Built for a UK disability-accessibility context. It is a planning document, not legal advice. Legal and technical claims should be checked before publication.

How to use this document

This document is a content blueprint. It does not try to write the final public-facing copy for every page. Instead, it tells you what every section of the final Access Pointers PDF should include, what evidence is needed, what to avoid, and how to make each section useful for disabled users, venues, partners, funders, and local authorities.

Core rule for the whole PDF: Do not reduce accessibility to wheelchair access. Cover mobility, sensory, communication, cognitive, neurodivergent, fatigue-related, visual, hearing, and assistance needs. Be evidence-led, plain-English, transparent, and disability-led.

The final PDF should be able to do four jobs at once:

- Explain the Access Pointers mission in a clear, professional way.
- Show venues exactly what information disabled people need before visiting.
- Give disabled users confidence that access claims are transparent and evidence-based.
- Help funders, councils, and partners understand the social and commercial value.

Recommended full PDF structure

Use this order if the PDF is aimed at venues, partners, and supporters. If the PDF is aimed mainly at disabled users, move sections 6-9 closer to the front.

Section	Title	Main job of the section
1	Front cover	Name, proposition, tagline, visual identity, and credibility cue.
2	Founder note / mission	Human reason for the project, disability-led values, and the problem being solved.
3	What Access Pointers is	Simple explanation of the platform, service, search tool, audits, AI assistant, and venue pages.
4	Why accessibility information fails	The gap: vague access claims, missing details, outdated photos, and lack of lived-experience context.
5	Who the platform supports	Different access needs, not just wheelchair users.
6	Accessibility categories	The full access checklist used to describe venues.
7	Venue profile page requirements	Exactly what every listing should contain.
8	Photo and evidence standards	Required photo angles, measurements, captions, and verification labels.

9	Rating / Access Stamp system	Transparent verification system and category-level access badges.
10	Ask the AI assistant	How the chatbot should work safely, accessibly, and with caveats.
11	Search and user journey	Website search, filters, map/list view, results cards, and accessible UX.
12	Venue audit service	What an audit includes, how findings are recorded, and how improvements are prioritised.
13	Venue improvement guidance	Low-cost fixes, staff training, medium-term improvements, and long-term investment.
14	Community feedback system	Disabled-user reviews, moderation, evidence, and safeguarding.
15	Platform accessibility standards	How the Access Pointers website, PDF, and chatbot stay accessible.
16	Legal and standards context	Equality Act, reasonable adjustments, WCAG, and publication caveats.
17	Partnerships and funding case	Why councils, venues, high streets, and funders should support it.
18	Business model and rollout plan	How it can make money while keeping user trust.
19	Tone, language, and inclusion rules	Disability-respectful language and editorial standards.
20	Appendices and templates	Venue checklist, measurement table, photo checklist, data fields, and glossary.

1. Front cover

Purpose: Make the PDF look like a serious accessibility product, not a school project or a generic charity leaflet.

Item	Details
What this section should include	- Access Pointers name and logo. - Clear subtitle: e.g. "Helping people find places that work for real access needs." - One-line proposition: venue finder, access information, verification, and improvement support. - Prepared date and version number. - Contact details or website URL once final. - Optional: "For venues, partners, funders and disabled users" if this is a mixed-audience PDF.
Evidence or assets needed	- Logo, final brand colours, website URL, contact email, and chosen tagline.
Design and layout guidance	- Large title, short subtitle, strong contrast, simple icon system, and no tiny text. Use an accessible font size and leave breathing space.
Avoid	- Do not overload the cover with paragraphs. The cover should sell clarity, trust, and purpose in under 10 seconds. - Avoid using only wheelchair imagery. One symbol can be useful, but the brand should communicate broad access needs.

2. Founder note and mission

Purpose: Give the document a human reason to exist without turning disabled people into a pity story.

Item	Details
What this section should include	- A short founder note explaining why the problem matters personally and practically. - A direct mission statement: make everyday venues easier to understand before people travel. - A social model framing: the issue is not disabled people being difficult; it is environments and information failing them.

	- A promise to be practical, honest, evidence-based, and built with disabled people. - A short line on independence, confidence, choice, safety, dignity, and spontaneity.
Evidence or assets needed	- Founder story, approved mission statement, and 2-3 values that should shape the brand.
Design and layout guidance	- Use a founder portrait only if it feels credible and professional. Otherwise use a simple quote box.
Avoid	- Avoid inspirational language that makes disability sound like a personal tragedy. - Avoid saying the platform can guarantee accessibility for everyone. No platform can do that.

3. What Access Pointers is

Purpose: Explain the product in plain English so a venue owner, disabled user, council officer, or funder understands it immediately.

Item	Details
What this section should include	- A one-paragraph overview of the platform. - The three-part offer: find accessible places, understand access details, and help venues improve. - Core features: accessible venue search, category filters, verified venue profiles, photos, measurements, user feedback, and AI assistant. - What it is not: not a replacement for legal advice, medical advice, professional building inspection, or personal support planning. - Who uses it: disabled visitors, families, carers, older people, tourists, venues, councils, and local business groups.
Evidence or assets needed	- MVP feature list, screenshots/wireframes, short product description.
Design and layout guidance	- Use a simple diagram: Search -> Understand -> Visit with confidence -> Venue improves.
Avoid	

	- Do not describe it as just a directory. It is a decision-support and trust platform. - Avoid vague tech phrases like "AI-powered accessibility revolution" unless you immediately explain what that means.
--	---

4. The problem: why access information fails

Purpose: Show the pain point clearly and specifically.

Item	Details
What this section should include	- Examples of bad access information: "disabled friendly", "wheelchair accessible", "call ahead", "some steps", with no measurements or photos. - Common user risks: wasted journeys, embarrassment, pain, unsafe transfers, lack of toilet access, sensory overwhelm, communication barriers, fatigue, and loss of independence. - Common venue problem: many venues want to help but do not know what information to collect or how to present it. - The trust gap: self-reported access claims are often incomplete, outdated, or too vague.
Evidence or assets needed	- Real examples of vague venue access descriptions, anonymised user frustrations, and mock access screenshots.
Design and layout guidance	- Use a "bad information vs useful information" comparison table.
Avoid	- Avoid blaming all venues. Frame the issue as a fixable information and design problem. - Avoid claiming every venue is legally non-compliant unless that has been assessed.

5. Who the platform supports

Purpose: Make clear that access is multi-dimensional.

Item	Details
What this section should include	- Wheelchair users and people using powerchairs, manual chairs, scooters, walkers, sticks, crutches, or orthotics.

	- People with limited stamina, fatigue, pain, respiratory conditions, neuromuscular conditions, balance issues, or fluctuating conditions. - Blind and partially sighted visitors. - Deaf, deafened, and hard-of-hearing visitors. - Neurodivergent people and people with sensory processing differences. - People with learning disabilities or cognitive access needs. - People with speech, language, or communication needs. - Assistance dog users, carers, personal assistants, older people, and families with prams.
Evidence or assets needed	- User personas or access need groups; no need for personal medical data.
Design and layout guidance	- Use grouped needs, not a long wall of diagnoses. Include plain examples: "needs a quiet route", "needs a chair with arms", "needs captions".
Avoid	- Avoid presenting one disabled person as representative of everyone. - Avoid medical labels when functional needs are more useful.

6. Core accessibility categories

Purpose: Define the categories that every venue profile and audit should cover.

Item	Details
What this section should include	- Arrival and transport: public transport, taxi drop-off, parking, distance to entrance, surfaces, gradients, lighting. - Entrance: step-free route, threshold, door type, door width, door weight, intercom, queue barriers. - Internal movement: corridor width, turning space, floor surfaces, ramps, lifts, clutter, lighting. - Seating and layout: table height, chair arms, booth seating, wheelchair spaces, resting points. - Toilets and changing: accessible toilet availability, transfer side, grab rails, emergency cord, sink/mirror height, changing facilities. - Sensory environment: noise, lighting, crowding, quiet areas, smells, music level, predictable layout. - Communication: menus, signage, hearing loop, captions, staff communication, easy-read info, booking options. - Service and staff support: trained staff, assistance dogs, flexible

	seating, queue support, evacuation understanding. - Digital access: accessible website, online booking, phone alternatives, map directions, menu accessibility. - Emergency access: evacuation routes, refuge points, alarms, staff procedure, user information.
Evidence or assets needed	- Final category list, icon set, field list, and venue data schema.
Design and layout guidance	- Use icons but always include text labels. Icons alone are not accessible enough.
Avoid	- Avoid creating badges for things you cannot verify. - Avoid a single "accessible / not accessible" label. Access depends on the person and the activity.

7. Venue profile page requirements

Purpose: Specify what every venue listing needs so users can make real decisions.

Item	Details
What this section should include	- Venue name, type, address, area, contact details, opening hours, booking link, and last updated date. - Verification status: verified by Access Pointers, self-reported by venue, community-submitted, or needs checking. - Quick access summary: best for, caution points, unknowns, and contact-before-visiting notes. - Filter badges: step-free entrance, accessible toilet, lift access, quiet area, hearing support, assistance dogs welcome, accessible parking. - Detailed measurements where available: widths, heights, step heights, ramp gradient, distances, turning circles, lift size. - Photo gallery with captions and alt text. - Known barriers and workarounds. - User reviews and lived-experience notes, clearly separated from verified facts.
Evidence or assets needed	- Venue data template, photo checklist, measurement checklist, verification workflow.
Design and layout guidance	- Design profile pages like decision cards: quick summary first, detailed evidence second.

Avoid	- Avoid hiding negative details. A clear limitation is more useful than a vague positive claim. - Avoid letting venues mark themselves as fully verified without evidence.
--------------	---

8. Photo and evidence standards

Purpose: Make the platform trustworthy by showing proof, not just claims.

Item	Details
What this section should include	- Exterior photo showing the approach from pavement or car park. - Entrance photo showing threshold, door, ramp, step, intercom, and handle where relevant. - Close-up of any step, threshold lip, ramp, or uneven surface with measurement when possible. - Internal circulation photos showing floor space, tables, routes, aisles, and turning points. - Accessible toilet photos: door, transfer area, rails, sink, mirror, cord, bin placement, and turning space. - Lift photos: doors, controls, inside dimensions, and landing space. - Sensory photos: lighting, crowding, quiet room, signage, and acoustic context. - Captions stating exactly what the image proves and what it does not prove.
Evidence or assets needed	- Photo upload guide, venue permission process, caption format, alt text rules.
Design and layout guidance	- Use consistent cropping, labels, and a "photo taken on" date.
Avoid	- Avoid flattering venue photography that hides barriers. - Avoid using wide-angle photos that make spaces look larger than they are unless measurements are shown. - Avoid people in private or vulnerable situations in toilet/changing photos.

9. Measurements and practical detail

Purpose: Make the information genuinely useful for planning a visit.

Item	Details
What this section should include	- Door widths, corridor widths, table clearance, turning spaces, ramp lengths and gradients where possible. - Step heights, threshold lips, surface changes, route distance from parking or public transport. - Accessible toilet dimensions and transfer side. - Lift door width, internal width/depth, button height, and whether a powerchair can turn nearby. - Seating details: chairs with arms, movable chairs, booth-only sections, bar-height seating, wheelchair spaces. - Lighting and noise notes with time-based context where possible: quietest times, live music nights, busy periods. - Plain labels for unknown measurements: "not yet measured" instead of leaving fields blank.
Evidence or assets needed	- Tape measure protocol, field checklist, guidance on metric units, venue survey form.
Design and layout guidance	- Use small tables and plain labels. Measurements must be scannable on mobile.
Avoid	- Avoid presenting estimates as measured facts. - Avoid legal minimum claims unless professionally verified.

10. Rating and Access Stamp system

Purpose: Create trust without oversimplifying disability access.

Item	Details
What this section should include	- A transparent rating logic based on categories, not one overall star score. - Clear labels: Verified, Self-Reported, Community-Reported, Needs Update. - Separate badges for mobility, toilets, sensory, communication, digital access, and staff support. - A date stamp: access conditions change, so users need to know

	when evidence was collected. - A rule that serious missing information lowers confidence even if the venue claims good access. - A pathway for venues to improve and be rechecked.
Evidence or assets needed	- Rating rubric, badge designs, verification rules, conflict-of-interest policy.
Design and layout guidance	- Use badge colours carefully. Do not rely on colour alone; include text and shape/label differences.
Avoid	- Avoid "fully accessible" as a default claim. It is almost never true for every disability. - Avoid selling a badge in a way that looks like pay-to-play verification.

11. Ask the AI assistant

Purpose: Explain how the chatbot helps without pretending it knows more than the evidence.

Item	Details
What this section should include	- A plain-English description: users can ask questions like "Can I get in with a powerchair?", "Is there a quiet area?", "Does the toilet have right-side transfer?" - Text input, microphone option, and simple example prompts. - Answers must cite the venue profile evidence it used: photos, measurements, user notes, venue data, or unknown fields. - Confidence labels: "confirmed", "likely", "unknown", "contact venue". - Clear boundaries: the AI does not guarantee access, cannot assess personal medical risk, and should not replace direct venue confirmation for high-risk needs. - Escalation: show venue contact details, map route, and "ask venue this exact question" template.
Evidence or assets needed	- AI policy, prompt examples, venue data schema, safety rules, fallback responses.
Design and layout guidance	- The assistant box should feel like a helpful access concierge: type box, mic, suggested questions, and answer cards.

Avoid	- Avoid AI answers that sound certain when data is incomplete. - Avoid hiding unknowns. Unknowns are useful and should be visible.
--------------	---

12. Search and user journey

Purpose: Show how users move from need to decision quickly.

Item	Details
What this section should include	- Homepage search bar with location input, not only a dropdown. - Filters for step-free entry, accessible toilet, lift access, quiet space, hearing loop, assistance dogs, accessible parking, and verified-only. - Result cards with venue name, distance, key badges, confidence status, top access limitation, and last checked date. - Map and list view, both keyboard accessible. - Clear "unknown" states so users are not misled. - Saved venues, share link, and print/download access summary for carers, PAs, or trip planning.
Evidence or assets needed	- Website wireframes, filter taxonomy, result card copy, route planning needs.
Design and layout guidance	- Use cards with strong hierarchy: name -> access summary -> badges -> detail link.
Avoid	- Avoid forcing users to open every listing to know basic access. - Avoid maps that are unusable with screen readers or keyboard navigation.

13. Venue audit service

Purpose: Turn Access Pointers into a practical improvement tool for businesses.

Item	Details
What this section should include	- What the audit covers: physical access, information access, staff service, sensory environment, digital journey, and emergency

	considerations. - What the venue receives: report, photos, measurements, priority fixes, quick wins, listing updates, and improvement badge pathway. - Audit method: walkthrough, measurements, photo evidence, staff questions, user journey testing, and follow-up. - Risk/prioritisation model: safety-critical, high-impact quick win, medium investment, long-term structural project. - Clear caveat: a general access audit is not the same as a formal building-control/legal compliance survey unless delivered by qualified specialists.
Evidence or assets needed	- Audit checklist, sample report, service pricing, terms, assessor training plan.
Design and layout guidance	- Use a sample one-page audit summary with traffic-light priorities, but avoid red/green alone. Add labels.
Avoid	- Avoid positioning the audit as a cheap legal certificate. - Avoid overpromising that one visit can capture every access need.

14. Venue improvement guidance

Purpose: Give venues a path, not just criticism.

Item	Details
What this section should include	- Low-cost changes: clearer website access info, better photos, staff briefing, reserved accessible seating, uncluttered routes, moved bins in toilets, better signage. - Medium changes: portable ramp review, doorbell/intercom, menu formats, induction loop, quieter booking times, seating adjustments. - Long-term changes: structural works, toilets, lifts, permanent ramps, doorway changes, acoustic treatment. - Staff training: how to ask, how not to patronise, assistance dog rules, communication options, emergency procedure awareness. - Before/after examples and improvement tracker.
Evidence or assets needed	- Venue improvement library, supplier list, training outline, policy templates.
Design and layout guidance	

	- Use "quick wins / next / later" boxes.
Avoid	- Avoid suggesting unsafe DIY ramp solutions. - Avoid implying that "staff can help lift someone" is an acceptable access solution.

15. Community feedback and safeguarding

Purpose: Use lived experience without turning reviews into abuse, blame, or unreliable claims.

Item	Details
What this section should include	- User reviews split into categories: mobility, toilet, sensory, staff, communication, booking, overall confidence. - Prompt users for specific details: date visited, time of day, mobility aid used if they choose to share, and what worked or failed. - Optional anonymous feedback. - Moderation rules: no abuse, no personal attacks, no health data required, no staff names unless necessary and fair. - Dispute pathway for venues and corrections pathway for users. - Flag outdated reports and contradictory evidence.
Evidence or assets needed	- Review policy, moderation guide, correction policy, privacy wording.
Design and layout guidance	- Use structured review prompts, not only open text.
Avoid	- Avoid requiring users to disclose diagnoses. Functional access needs are enough. - Avoid deleting negative access experiences just because a venue dislikes them.

16. Platform accessibility standards

Purpose: Make Access Pointers practise what it preaches.

Item	Details
What this section should include	

	- Website and app target: WCAG 2.2 AA as the practical baseline. - Keyboard navigation, visible focus states, skip links, meaningful headings, responsive layout, readable text, and strong contrast. - Screen-reader labels for icons, filters, buttons, maps, and chatbot controls. - Alt text for all meaningful images and captions for venue photos. - Captions/transcripts for video content. - Plain English, easy-read summaries where possible, and no essential information hidden in images. - Accessible PDF export: tagged headings, bookmarks, selectable text, alt text, high contrast, and correct reading order.
Evidence or assets needed	- Accessibility statement, WCAG audit checklist, design system rules, PDF export process.
Design and layout guidance	- Use simple layouts. Accessibility is part of brand trust, not an afterthought.
Avoid	- Avoid inaccessible overlays as the only accessibility solution. - Avoid tiny grey text, icon-only buttons, unclear form labels, and keyboard traps.

17. Legal and standards context

Purpose: Give enough legal context to be credible without pretending the PDF is a legal opinion.

Item	Details
What this section should include	- Brief mention that UK service providers have duties under the Equality Act 2010, including reasonable adjustments where disabled people would otherwise face substantial disadvantage. - Explain reasonable adjustments in plain terms: changes to physical features, policies, procedures, communication, staff practice, or auxiliary aids depending on context. - For Access Pointers digital services, refer to WCAG 2.2 principles: perceivable, operable, understandable, robust. - If working with public sector organisations, mention the Public Sector Bodies Accessibility Regulations 2018 and accessibility statements. - For building detail, refer to appropriate professional standards and qualified access consultants where needed.
Evidence or assets needed	- Reviewed legal wording, source list, professional caveat,

	qualified consultant input.
Design and layout guidance	- Use a legal-context page near the back, not as the emotional lead.
Avoid	- Avoid saying a venue is Equality Act compliant or non-compliant unless legally/professionally assessed. - Avoid copying technical standards into the PDF without interpreting them for real users.

18. Partnerships and funding case

Purpose: Show why Access Pointers matters beyond one website.

Item	Details
What this section should include	- Benefits for disabled people: independence, confidence, reduced wasted journeys, safer planning, more social participation. - Benefits for venues: more customers, better trust, fewer access misunderstandings, clearer staff processes, positive reputation. - Benefits for councils/high streets: inclusive local economy, tourism access, social value, data on access gaps. - Potential partners: councils, BID groups, tourism boards, disability charities, universities, NHS/community groups, local business networks. - Impact metrics: number of venues mapped, verified profiles, improvements completed, user searches, user confidence ratings, accessibility issues resolved.
Evidence or assets needed	- Partner list, funding targets, local pilot area, impact measurement plan.
Design and layout guidance	- Use an impact dashboard mockup with 5-6 metrics.
Avoid	- Avoid sounding like a charity-only project if the business model is commercial. It can be mission-led and commercially sustainable.

19. Business model and rollout plan

Purpose: Show how the platform can survive without damaging user trust.

Item	Details
What this section should include	- User side: free venue search and access information should remain the trust anchor. - Venue side: paid enhanced profiles, audits, improvement reports, training, and annual rechecks. - Partner side: council mapping projects, sponsored access improvement campaigns, local area reports. - Revenue safeguards: paid listings must be clearly labelled and cannot override access evidence. - Rollout: local MVP, 25-50 pilot venues, disabled-user testing, venue feedback, refinement, then regional expansion. - Operating needs: data collection, audit training, moderation, customer support, technical maintenance, and accessibility QA.
Evidence or assets needed	- Pricing options, pilot list, operational workflow, local launch plan.
Design and layout guidance	- Use a simple timeline: MVP -> Local pilot -> Verified listings -> Partner reports -> Regional growth.
Avoid	- Avoid pay-to-rank search results unless clearly labelled and ethically controlled. - Avoid scaling nationally before the verification model works locally.

20. Tone, language, and inclusion rules

Purpose: Protect the brand from sounding patronising, vague, or outdated.

Item	Details
What this section should include	- Use disabled people, wheelchair users, blind people, Deaf people, neurodivergent people - but respect individual preferences. - Use functional language: "step-free entrance", "left-side toilet transfer", "quiet area", "staff can provide written information". - Avoid phrases like wheelchair-bound, confined to a wheelchair, special needs, suffers from, differently abled, vulnerable people

	as a blanket label. - Write in direct, plain English. - Be honest about limits: "unknown", "not yet verified", "contact venue". - Do not infantilise disabled adults or frame basic access as generosity.
Evidence or assets needed	- Brand voice guide, copy examples, glossary, moderation wording.
Design and layout guidance	- Use a short editorial style guide page with approved and banned phrases.
Avoid	- Avoid fluffy inclusion slogans unless backed by practical details. - Avoid making disabled users sound like a marketing segment rather than real customers and citizens.

21. Appendices and templates

Purpose: Put the practical assets at the back so the PDF becomes useful, not just persuasive.

Item	Details
What this section should include	- Venue data collection form. - Photo checklist. - Measurement checklist. - Access category field list. - Venue self-report questionnaire. - User feedback form. - AI assistant example questions. - Glossary of access terms. - Version history and source references.
Evidence or assets needed	- Templates, forms, sample profile, glossary terms, references.
Design and layout guidance	- Use forms, checklists, and tables. Appendices should be printable and reusable.
Avoid	- Avoid burying key access principles only in the appendices. The main document should still make the approach clear.

Final PDF production checklist

Before publishing the final Access Pointers PDF, check each item below. This is where the document moves from "good idea" to professional, disability-led material.

Check area	Question to answer	Status
Strategic clarity	The PDF explains the problem, the user need, the product, the service, the trust model, and the business case without making the reader guess.	Not started / In progress / Done
Disability breadth	The document covers mobility, sensory, communication, cognitive, neurodivergent, visual, hearing, fatigue, and assistance needs.	Not started / In progress / Done
Evidence-led access	Every claim has a source type: measurement, photo, venue confirmation, user report, or unknown.	Not started / In progress / Done
No overclaiming	The PDF avoids "fully accessible", legal compliance claims, or AI certainty unless professionally verified.	Not started / In progress / Done
Useful to venues	Venues can see exactly what to collect, what to improve, and how Access Pointers helps them.	Not started / In progress / Done
Useful to disabled users	Users can see that the platform understands real-world planning, uncertainty, dignity, and safety.	Not started / In progress / Done
Accessible PDF design	Tagged headings, selectable text, strong contrast, readable font size, alt text, correct reading order, and no information conveyed by colour alone.	Not started / In progress / Done
Commercial trust	Paid features are labelled and do not corrupt access evidence or user confidence.	Not started / In progress / Done
Local launch readiness	The first pilot area, first venue types, first profile fields, and first audit workflow are clear.	Not started / In progress / Done
Review process	A disabled-user review stage and professional access/technical review stage are planned before public release.	Not started / In progress / Done

Appendix A: minimum venue profile field list

Field group	Required content
-------------	------------------

Basic venue details	Name, category, address, contact, website, opening hours, booking link, price range.
Verification status	Verified / self-reported / community-submitted / outdated / needs checking, with date.
Arrival	Parking, public transport, taxi drop-off, path surface, gradient, lighting, distance.
Entrance	Step-free route, step height, threshold, door width, door type, opening force, intercom.
Inside layout	Aisle/corridor width, turning space, seating type, floor surface, crowding, route clarity.
Toilets	Accessible toilet, transfer side, rails, cord, sink height, turning space, changing bench if any.
Sensory	Noise, lighting, quiet area, peak times, music, smell, crowding, predictable layout.
Communication	Menus, signage, hearing loop, captioned media, staff communication options, easy-read options.
Service	Assistance dogs, queue support, flexible seating, staff training, emergency procedure awareness.
Photos	Exterior, approach, entrance, threshold, interior route, seating, toilet, lift, signage.
Known barriers	Anything that could prevent access, with workarounds if safe and realistic.
User notes	Structured lived-experience feedback, date of visit, and category-specific ratings.

Appendix B: useful source grounding

These are the types of sources the final public version should reference or use for its review process. Keep the public PDF readable; put detailed source links in the references or appendix rather than overloading the main sections.

Source type	How to use it
Equality Act 2010 service-provider duties	Use for the legal context around disabled access, discrimination, and reasonable adjustments.
GOV.UK reasonable adjustments guidance	Use for plain-English examples of physical, policy, process, communication, and training adjustments.
WCAG 2.2 and GOV.UK service guidance	Use for the platform website, chatbot, and PDF accessibility

	standards.
Public Sector Bodies Accessibility Regulations 2018	Use when talking to councils, public bodies, universities, or publicly funded partners.
Access consultants / occupational access professionals	Use when claims require professional judgement beyond a general platform audit.
Disabled-user testing and lived-experience review	Use to keep the platform practical and not just technically correct.

Best next step: Use this blueprint to write the public-facing Access Pointers PDF, then test it with disabled users and at least one venue owner before turning it into a designed brochure or pitch deck.
